

Twin Station Series 20

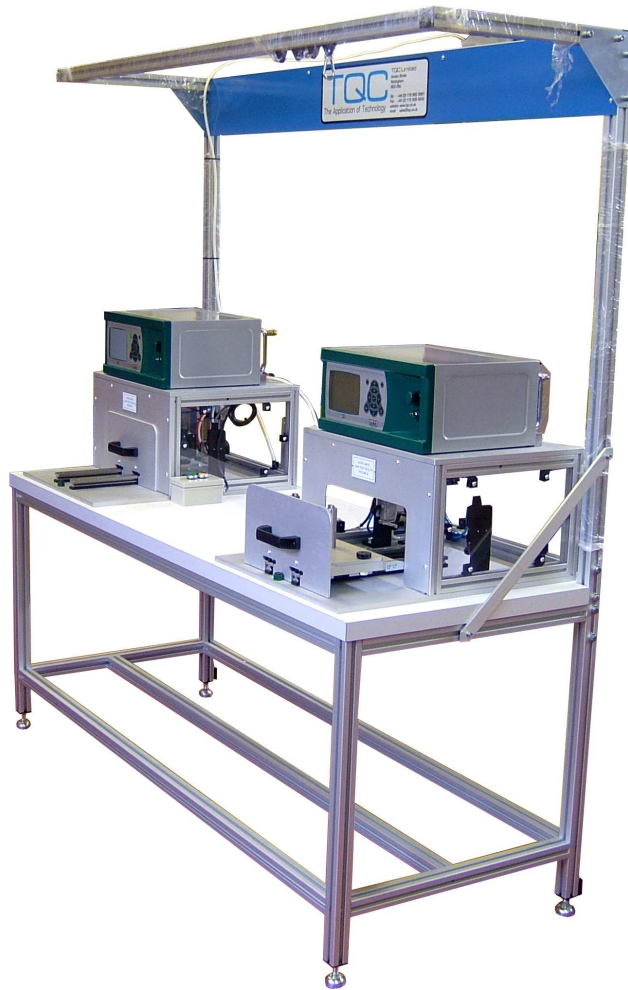

Standard Leak Testing Equipment

TQC have recently developed a range of standard leak testing benches.

Series 20 leak test benches apply a small level of automation which is controlled by the leak test instrument.

The equipment on the right uses Nolek S9 leak test instruments for the air decay leak test and to control the sealing mechanism within the test fixture.

To increase throughput, a twin station machine was supplied allowing a single operator to work alternately between the two fixtures, or two operators can working independently on each fixture.

This specific example of a Series 20 Twin Station Machine incorporates:

- Standard aluminium extrusion bench framework
- Self guarding drawer style fixtures
- Interchangeable fixtures to handle part variants
- Nolek S9 leak test instrument
- Pneumatic impact marker pass stamp
- Suitable for medium volume applications
